

Are you affraid of an intestinal (colorectal) malignancy?

Colorectal malignancies:

- the 3rd most common malignant disease in Czech Republic
- new diagnosed tumors have the highest frequency in the world
- more than a half of these tumors are diagnosed in the late stadium
- the investigation paid from Health Insurance in Czech Republic for people older than 54 years: occult bleeding in the stool once in 2 years
- it is possible to test occult bleeding in the stool paid in cash (without a visit of any doctor)

Our medical laboratory can offer occult bleeding test in your stool based on a new immunochemical quantitative test OC Sensor Eiken.

Why to choose this test?

- **3fold higher sensivity** for serious changes on colorectal mucous membrane in a comparison with usual guajacul tests (f. e. Hemoccult)
- **high specificity for human blood**, minimal false positivity
- **minimal burden** (only one test without a prior diet)
- patent sampling system eliminates incorrect stool sampling (and so, an incorrect test result, too)

It is possible to be investigated by a gastroenterologist in our hospital if your test result is positive.

The prize: 150,- Kč (paid before if you collect a sampling bottle)

When: daily from 8:00 till 18:00h (the result in a week)

It is necessary to collect a sampling bottle in our lab before!

If you are interest in this occult bleeding test in your stool, please contact our laboratory:
